## VSCode 配置Debug流程

1、在rucbase-lab/CMakeLists.txt文件夹中添加如下命令:

```
set(CMAKE_CXX_FLAGS "-Wall -00 -g -ggdb3")
# set(CMAKE_CXX_FLAGS "-Wall -03")

set(CMAKE_CXX_FLAGS_DEBUG "${CMAKE_CXX_FLAGS_DEBUG} -00 -g")
set(CMAKE_C_FLAGS_DEBUG "${CMAKE_C_FLAGS_DEBUG} -00 -g")
```

2、点击"运行(Run)--添加配置(Add Configuration)"添加launch.json文件

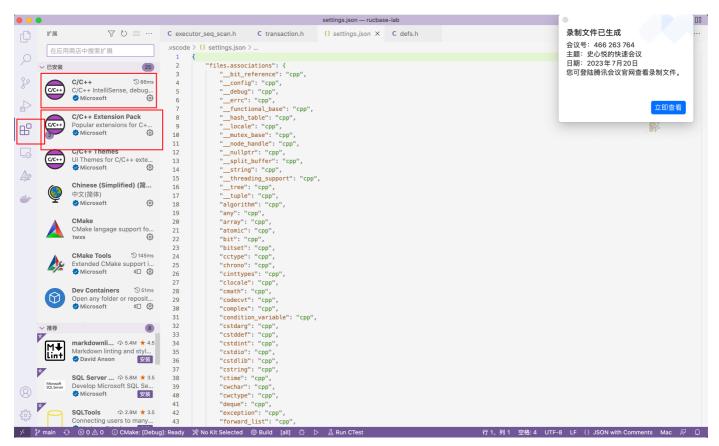

将群文件中的launch.json文件中的内容复制粘贴到新创建的launch.json文件中

其中,launch.json文件中通过"program"参数来指定Debug的目标执行单元,比如以下界面中,对rucbase可执行单元进行gdb:

```
// Use IntelliSense to learn about possible attributes.
// Hover to view descriptions of existing attributes.
// For more information, visit: https://go.microsoft.com/fwlink/?linkid=830387
//\ /home/zqs/star/bench\_tpcc\ --logtostderr=1\ --id=1\ --servers="10.77.110.144:10215; 10.77.110.145:10216; 10.77.110.148:10217"
"version": "0.2.0",
"configurations": [{
   "name": "c++ Launch",
    "type": "cppdbg",
    "request": "launch
    "program": "${workspaceFolder}/build/bin/rucbase",
                                                        //bench_ycsb", // 需要执行的文件位置    ycsb" test/workload_cluster_test
     'args": [
       "testdb"
    ], // 输入的参数 "-f", "../../etc/observer.ini"
   "stopAtEntry": false,
    "cwd": "${workspaceFolder}/build/", // 当前运行的位置 // "cwd": "${workspaceFolder}",//
    "environment": [],
    // "terminal": "external",
    "externalConsole": false,
    "MIMode": "gdb",
    "setupCommands": [{
        "text": "-enable-pretty-printing",
        "description": "enable pretty printing",
        "ignoreFailures": true
    //"preLaunchTask": "bench_tpcc", //与tasks.json 的label项目同名
    "targetArchitecture": "x86_64",
    "miDebuggerPath": "/usr/bin/gdb"
}]
```

如果需要对其他可执行单元进行Debug,需要把"program"的值改为对应可执行单元的路径。

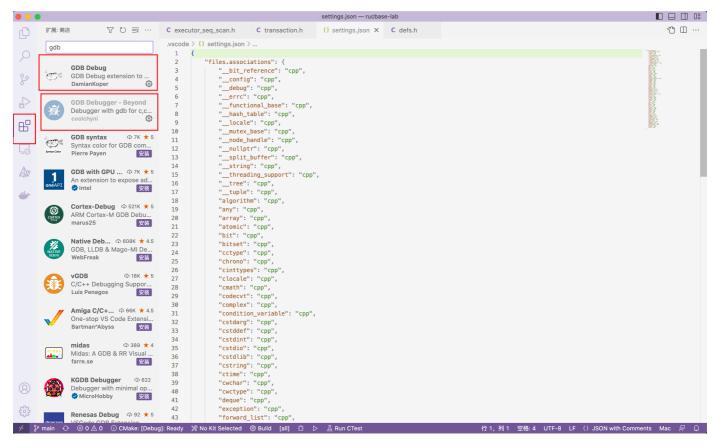

3、在左侧的扩展插件中下载C++相关插件

4、在命令行中执行下载安装gdb:

在命令行中执行如下命令:

## 5、在左侧的扩展插件中安装gdb相关插件:

## 6、使用gdb进行Debug
